

Python Variables — Cheat Sheet

Module SC101 · keep this next to you while coding · Social Coding SA

Creating & changing

```
x = 10          # create
x = x + 5       # update (now 15)
x += 5         # shortcut (now 20)
name = "Sipho"  # strings use quotes
```

Types & conversion

```
int("7")       -> 7          str(7)    -> "7"
float("1.5")    -> 1.5       int(3.9)   -> 3    (chops, no rounding)
type(x)         -> tells you what x is
```

Strings

```
first = "Naledi"
len(first)          -> 6
first.upper()       -> "NALEDI"
first + " Mokoena"  -> "Naledi Mokoena"
f"Hi {first}!"      -> "Hi Naledi!"    (f-string)
```

Printing & input

```
print("Marks:", marks)
answer = input("Your name? ")  # input is ALWAYS a str
age = int(input("Age? "))      # convert to use as number
```

If you see this error...

NameError: you used a variable before creating it (or typed the name wrong). **TypeError**: you mixed types — convert first. **SyntaxError**: check quotes and brackets are closed.
